

ABSTRACT OF THE DISCLOSURE

There is provided a method for sending voicemail messages to multiple recipients for instantaneous playback. An input is received that selects the multiple recipients from a stored list of users (310). Phone numbers of the multiple recipients are sent to a temporary voicemail server, in response to the receiving step (315). A voicemail message is received (320, 325). Internet Protocol (IP) addresses of the multiple recipients are determined from the phone numbers, by the temporary voicemail server (335). IP packets that include the voicemail message are sent to any of the multiple recipients that have an active mobile terminal (345). The input and the voicemail message received at the receiving steps are provided by an originating sender of the voicemail message.
